Revised Proposal

v1.1 = updated | green = new

Our recommendation

OVERVIEW

Oracle's burn crisis is a cost visibility problem — ContractOS solves it with five AI agents that read every contract, catch every invoice error, and show exactly where the money is going.

Three supporting arguments

01

The problem is real

9 pain points discovered blind — all confirmed by verbatim transcript. Revenue side cannot be fixed. Only lever is cost.

02

The solution is defensible

5 AI agents, one per capability. Human-in-the-loop technically enforced. EU AI Act minimal/limited risk.

03

The system is observable

LangSmith live — 6 runs complete, all 5 agents traced, PII redacted, full audit trail for regulators.

Oracle has no visibility over where the money goes

Discovered blind — 10 indirect questions, 0 direct pain-point asks

01 CLIENT & PROBLEM

900 people · 5 jurisdictions · high burn · no contract register · no single cost view.

CEO / CTO: Eugen (co-founder) — mission-driven, avoids financials

CFO: Thibaud — new to AI, needs cost visibility, wants break even

Size: ~900 FTEs, part-time, contractors, interns

Countries: Russia · India · Pakistan · Bangladesh · Philippines

Revenue: B2C indie games, one-time purchase — no subscriptions

Lever: Revenue side is structurally fixed — only cost can move

Pain points uncovered

- No contract visibility — 900 contracts unread
- Wrong invoicing — amounts not matching contracts
- Lost contractors — duplicate or inactive payments
- Paying twice — contractor = internal role scope
- No cost visibility — burn untraceable by category
- Multi-country payroll bottleneck + intermediaries
- Compliance unknown — asked unprompted
- IP at risk — ambiguous contractor IP clauses

ContractOS — five agents, one per capability, zero automated decisions

02 THE SOLUTION

One interface. Five AI agents orchestrated by LangGraph. Every output goes to a human before any action.

1

Contract Intelligence

Agent 1

LLM ingests contracts, extracts JSON: name, role, rate, currency, jurisdiction, notice period, IP clause, GDPR clause, working arrangement. Output to Contract Register DB.

2

UPDATED v1.1

Invoice Validation

Agent 2

Validates invoices vs contract terms. Flags amount, currency, scope mismatches. **Now also:** PO matching + local accounting rules per jurisdiction.

3

Overlap Detection

Agent 3

Semantic similarity: contractor scope vs internal job roles. Flags pairs where overlap exceeds threshold. Output: overlap alert + estimated duplicate cost.

4

UPDATED v1.1

Compliance Flagging

Agent 4

Red/Amber/Green per contract: GDPR, IP, misclassification (NL DBA, German rules). **Now also:** EOR flag for countries where Oracle has no legal entity.

5

UPDATED v1.1

Cost Categorisation

Agent 5

Categorises all spend by country, type, team, intermediary. **Now includes:** EOR fees + intermediary subcategories. Alert if intermediary > 30% of country spend.

⚠ Human approves every flag before any payment is sent or any contractor is reclassified — this is technically enforced, not just policy.

AI only where language understanding is required — everything else is plain software

02 AI vs SOFTWARE

This boundary is what keeps the system auditable, maintainable, and cost-efficient.

Needs LLM reasoning

- ◆ Extracting data from unstructured multilingual contract templates
- ◆ Semantic overlap: contractor scope vs internal job role descriptions
- ◆ Misclassification risk from natural language working arrangements
- ◆ Missing clause detection using jurisdiction-specific legal knowledge
- ◆ Invoice anomaly detection across inconsistent multilingual formats

Plain software sufficient

- Structured database storage of extracted fields
- Cost dashboard charts and aggregation
- Payment routing via Wise API or local intermediary
- Access control and role-based permissions
- Audit trail logging and notification alerts

ContractOS is minimal/limited risk — justified, not asserted

03 COMPLIANCE — EU AI ACT

No agent executes a decision. Every output goes to a named human before action. This is what keeps the classification defensible.

MINIMAL RISK

Contract extraction · Cost dashboard · Payment tracking

Surfaces information only. No decisions affecting individuals.

LIMITED RISK

Overlap detection · Misclassification flagging

Touches Annex III pt.4 territory — human legal review required before any reclassification.

Roles & Obligations

SilverTrust = PROVIDER

- Maintain technical documentation
- Implement quality management + logging
- Ensure human oversight is technically enforced

Oracle Game Studio = DEPLOYER

- Maintain human review for all flags before action
- Inform workers AI analyses their contracts
- Conduct own DPIA before deployment

Every data use has a named lawful basis — three LIAs completed

03 GDPR & OTHER LAW

No personal data leaves EU infrastructure. LLM processing runs under documented legitimate interest.

Personal data use	Lawful basis	Article	Constraint / Action
Employment contracts	Contract performance	6(1)(b)	No consent needed
Payroll records & invoices	Legal obligation	6(1)(c)	Tax + labour law retention
LLM contract processing	Legitimate interest	6(1)(f)	LIA completed · EU infra · DPA signed
LangSmith traces	Legitimate interest	6(1)(f)	PII redacted · 90-day retention max

Other Applicable Law

NL DBA Act (2025): Agent 4 flags misclassification — human + legal review before reclassification

German BetrVG: Works council consulted before go-live — SilverTrust provides documentation

India DPDP / Philippines DPA: Data stays EU-side — local counsel for processing obligations

Russia: Out of scope v1 — sanctions + data localisation require specialist legal advice

The black box has windows — every AI decision is logged and auditable

04 MONITORING

If a regulator asks what happened with a specific contractor, we show the complete chain in under five minutes.

Extraction confidence Alert < 0.80 on rate, jurisdiction, IP

Failed extractions Zero tolerance — immediate alert

Human override rate Alert > 20% in 7-day window

Compliance flag trend Alert if Red > 10% of new contracts

Latency per agent Alert p95 > 30 seconds

PII redaction audit Weekly — zero tolerance for PII in traces

✓ **Live — contractos-oracle-prod**

6 runs complete · All 5 agents traced · EU endpoint: eu.api.smith.langchain.com · PII redacted

"Here is where you can see everything the AI did, catch a mistake before it costs you money, and prove to an auditor what happened — in under five minutes."

What changed

Oracle approved v1.0 — seven change requests addressed in v1.1.

CR-01 EOR coverage — **Now**

CR-02 Social registration — **Phase 2**

CR-03 Contract generation — **Phase 2**

CR-04 PO matching — **Now**

CR-05 Accounting rules — **Now**

CR-06 Intermediary costs — **Now**

CR-07 Multilingual QA — **Now**

Phase 1 — immediate enhancements to existing agents

Four change requests, no new agents required, ready for v1.1

06 REVISED PROPOSAL

Agents 2, 4, and 5 extended. Nothing removed. Classification unchanged — all outputs still go to human review.

Agent 4

NEW v1.1

EOR Coverage

CR-01

Flags contracts in countries where Oracle has no legal entity. Output: EOR required flag + estimated cost range + recommended action. Agent 5 tracks EOR fees as a named cost subcategory.

Agent 2

NEW v1.1

PO Matching + Local Accounting Rules

CR-04+05

Three-way match: invoice vs contract vs PO. Also checks jurisdiction-specific accounting thresholds — Germany, India, Philippines in v1.1. Flags if invoice triggers different accounting treatment.

Agent 2+5

NEW v1.1

Intermediary Cost Tracking

CR-06

Intermediary fees tracked as adjacent costs: staffing_agency · eor_provider · government_fee · legal_counsel. Alert if intermediary costs exceed 30% of country spend.

Phase 2 — new capabilities after go-live stabilisation

06 REVISED PROPOSAL

Client requested full process automation up to the human signature step. Compliance research required before commitment.

CR-02 Social Registration Automation

Trigger: New contract created in target country

- Pulls country-specific social security + insurance requirements
- Pre-fills registration forms with contract data
- Routes to HR for review and official submission
- Human submits to government bodies — agent prepares only

⚠ **Pre-condition: legal review per jurisdiction before automation**

CR-03 Contract Generation Workflow

Trigger: HR onboards a new worker

- Collects: name, role, country, contract type, rate, start date
- LLM generates draft using jurisdiction-specific template
- Draft produced in local language + English
- Lawyer reviews first template per country — approved templates reused

⚠ **Auto-signing explicitly out of scope — human signature always required**

Change log — request → action → why

Five accepted (Phase 1), two scoped (Phase 2), two push-backs. Every decision has a reason.

CR	Action	What changed	Why
CR-01	✓ Accepted	EOR flag → Agent 4 EOR fees → Agent 5	Oracle has no entity in 5 countries — this was a gap in v1.0
CR-04	✓ Accepted	Agent 2: three-way match (invoice + contract + PO)	Oracle issues POs; contract-only match misses a real mismatch vector
CR-05	✓ Accepted	Agent 2: local accounting thresholds per jurisdiction	Same invoice = opex in Germany, capex in India — must flag before payment
CR-06	✓ Accepted	Intermediary tracking Agent 2 + Agent 5	47% of burn through agencies — visible in data, should have been in v1.0
CR-07	✓ Accepted	Formal 3-phase multilingual QA plan, 7 languages	Informal confidence ≠ compliance measure. GDPR requires documented safeguards
CR-02	⌚ Phase 2	Social registration automation per country	Feasible — legal review per jurisdiction required before automating filings
CR-03	⌚ Phase 2	Contract generation workflow (pre-signature)	Scoped and agreed. Compliance research required before commitment
Auto-sign	✗ Rejected	Automated contract signature	Multi-jurisdictional employment contracts require human review — legal risk

07 The Revised Ask — ContractOS v1.1

07 THE REVISED ASK

ContractOS v1.0 approved — five agents, compliance, LangSmith monitoring

Seven change requests received and documented — all addressed in this revised proposal

Phase 1 enhancements ready: EOR flagging · PO matching · intermediary cost tracking · accounting rules

Phase 2 scoped: social registration automation + contract generation workflow (post go-live)

Multilingual QA plan formalised: 3 phases, acceptance criteria per language, 7 languages covered

Auto-signing out of scope — human signature always required — accepted by client

Do you approve ContractOS v1.1 for Oracle Game Studio?
